5 Function

- **Modifying the Shifting Signal:** The by-wire interface modifies the shifting signal when power is applied and the required CAN messages are received. The vehicle shifting system will function regardless of the CAN messaging and applied power to the by-wire interface.
- **Power-off State:** Without power applied, the hardware passes signals through unaltered.
- **Disabled State:** In the disabled state, signals are not modified. This corresponds to GCMD = 0.
- **Power-up State:** The by-wire interface powers up in the disabled state. GCMD = 0.
- **Driver Override:** If the driver requests a shift, this is reported in the CAN shifting report message with DRIVER = 1. This is automatically cleared on the next by-wire shift request, but can also be cleared by setting CLEAR to 1 in the CAN shifting command message.

6 Supported Vehicles

The Shift By-Wire interface has been tested on the Lincoln Aviator for model year 2020.
